m<sup>2</sup>K A = Heat transfer surface area (m<sup>2</sup>) C min = Minimum of C h or C c (kJ/K) In the present study, steam is condensing while passing through the heat exchanger. Hence, C h → ∞. Thus, the capacity

ratio,  $C_r = C_{\min} / C_{\max} = 0$ . For such a case, NTU can be

calculated using the following relationship between  $\epsilon$  and NTU:  $NTU = -\ln(1 - \epsilon) \dots$
